

Continuing Aeroo Reports for OpenERP development video howto's series for beginners.

OpenOffice service setup in Windows environment for Aeroo Reports additional reporting output formats, such as pdf or xls.

Here we set up OpenOffice to run as a service in MS Windows. This service is required by report_aeroo_ooo module which provides additional Aeroo reports output formats, such as .pdf, .xls, .doc. This service can be accessed later from any running OpenERP server machine (Linux, Windows etc.) for report conversion.

Note! That you do not need this service, if you use just .odt or .ods formats as your reports output.
